

Activating the student's prior knowledge in the learning of third Newton law through a P.O.E. (“Predict-Observe-Explain”) strategy.

International Conference
**NEW PERSPECTIVES
in SCIENCE EDUCATION**

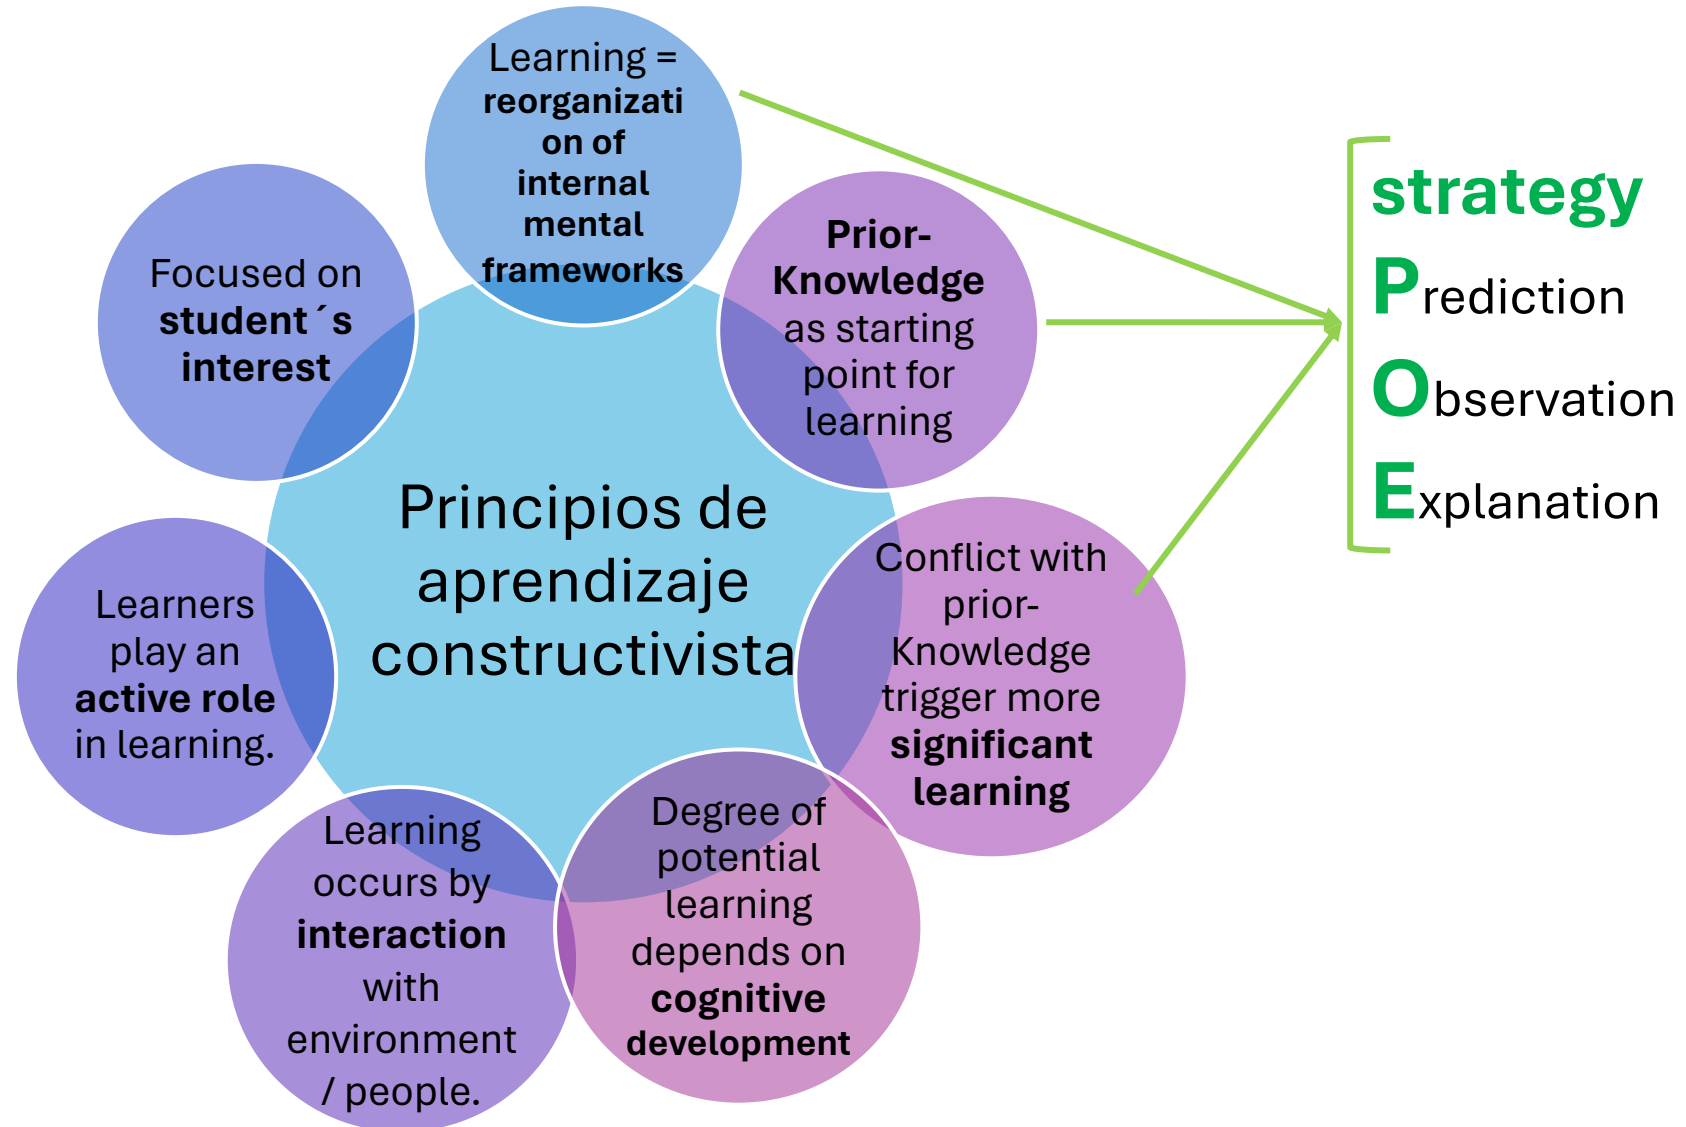

**Laboratory hand-on
activities are traditionally used in
secondary education as:**

VERIFICATION

of the new knowledge
learned in the theory class

Rethinking lab activities from the constructivism perspective

Flip the order: lab activities first

Use the lab hand-on activities to introduce new scientific concepts may improve:

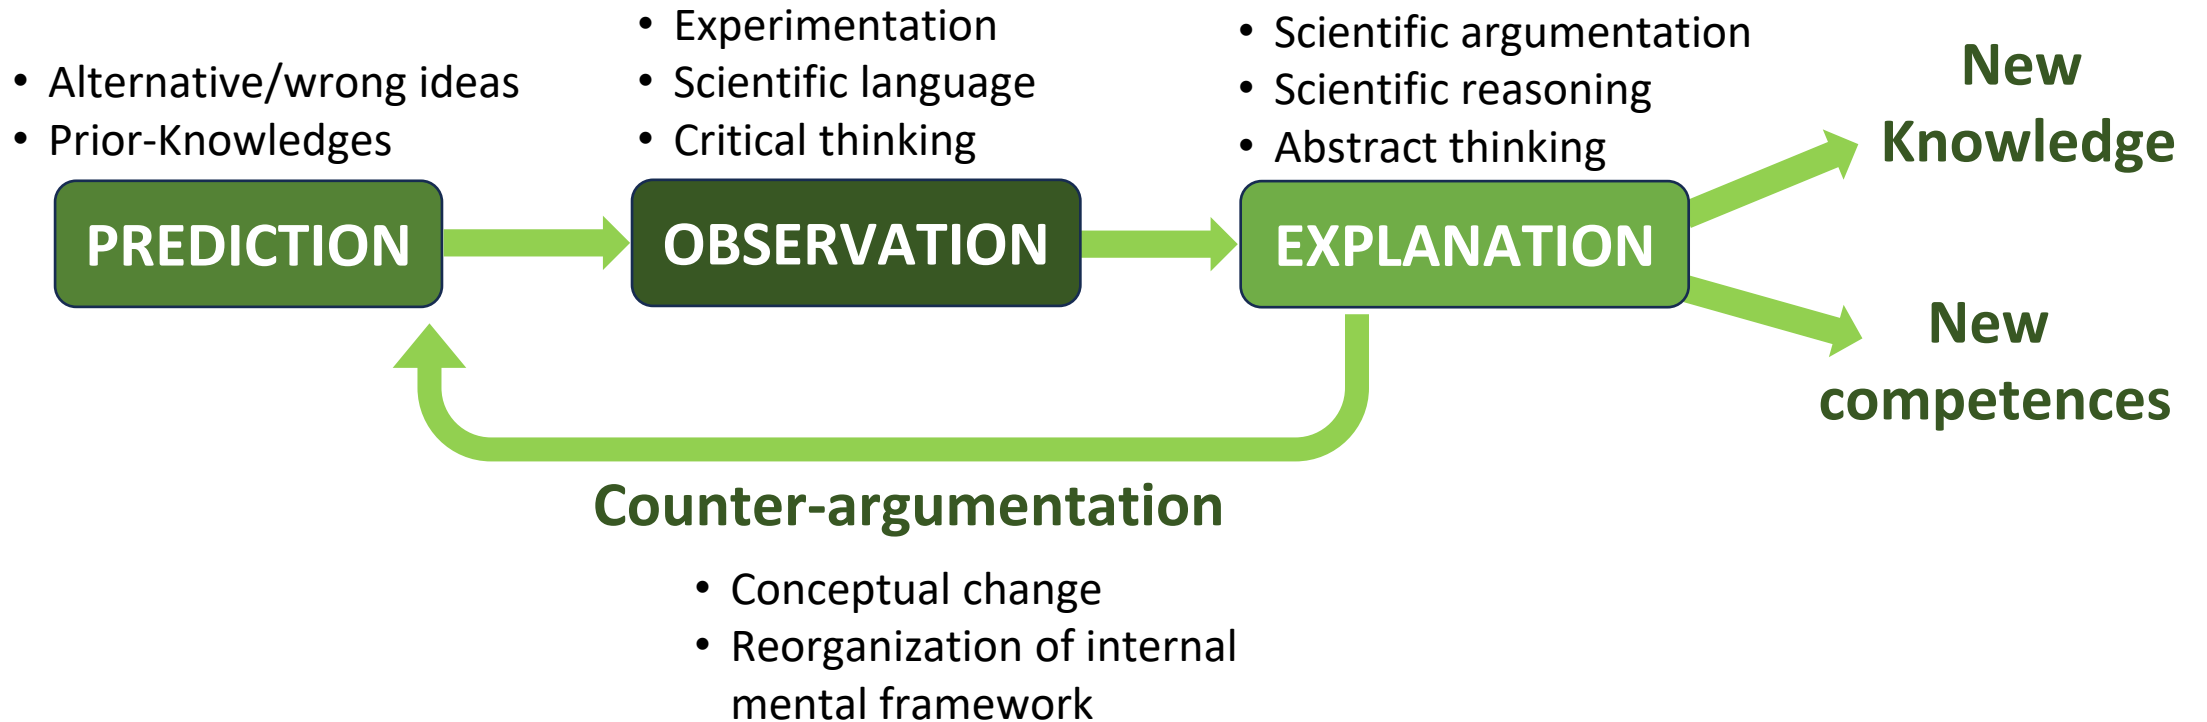

- **Activation of prior-knowledge**
- **Abstract thinking**
- **Scientific argumentation**

to enhance

significant learning

Steps of the P.O.E. strategy

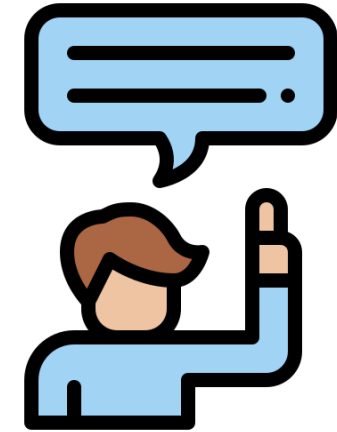

But... **not all experiments work** to introduce new scientific concepts to the students

It is necessary to rethink hand-on lab experiences to use the P.O.E. strategy

Counter-intuitive experiments work better

As more **counterintuitive** the experiment is

higher conflict with the prior knowledge

more internal mental rearrangement

More **abstract thinking & scientific argumentation** are needed

Higher significant learning

Newton's Laws of Motion

1st Law

A body in motion remains in motion or a body at rest remains at rest, unless acted upon by a force.

2nd Law

Force equals mass times acceleration: $F = m \cdot a$

3rd Law

For every action, there is an equal and opposite reaction.

On the teaching of **Newton's Laws** using a P.O.E. strategy

First law

Every body remains in a state of rest or uniform motion unless acted upon by a net external force.

Second law

$$F=ma$$

The amount of acceleration of a body is proportional to the acting force and inversely proportional to the mass of the body.

Third law

For every action there is an equal but opposite reaction. If an object A exerts a force on object B, then object B will exert an equal but opposite force on object A.

PREDICTION step in the POE strategy

**POE STRATEGY
SHOULDN'T BE
ADVERTISED
IN ADVANCE**

**PREDICTION SHOULD
BE PRESENTED
UNDERCOVER,
among other questions**

**The goal is to detect alternative ideas and
misconceptions in the Prior Knowledge of students**

PREDICTION step in the teaching of Newton's law

Predictions related with experiment 1

- 1 Does the scale show the same, more, or less weight if you step on it with one foot compared to stepping on it with both?
- 2 If you step on the scale on the Moon, would it indicate more, less, or the same weight?
- 3 Would your mass on the Moon be the same, more, or less than on Earth?
- 4 Does the scale show the same, more, or less weight if you lean on a friend?
- 5 If you stand on tiptoes on the scale, does it always show the same weight?

This is the question to cover the important prediction

This is the important question

PREDICTION step in the teaching of Newton's law

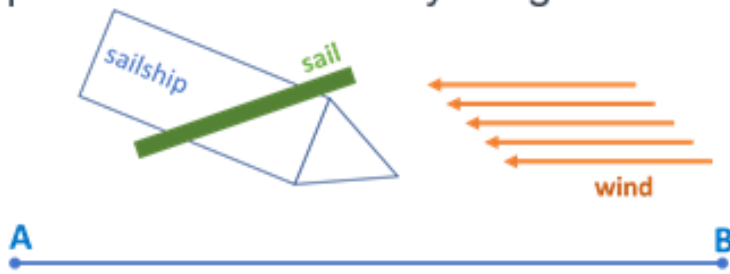

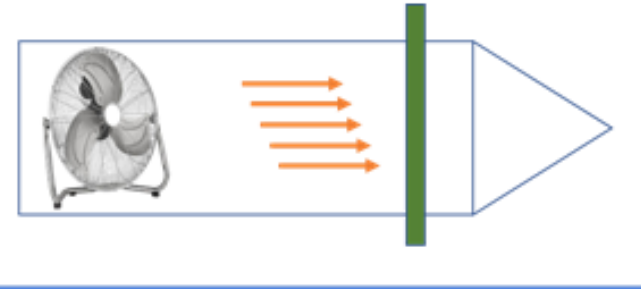

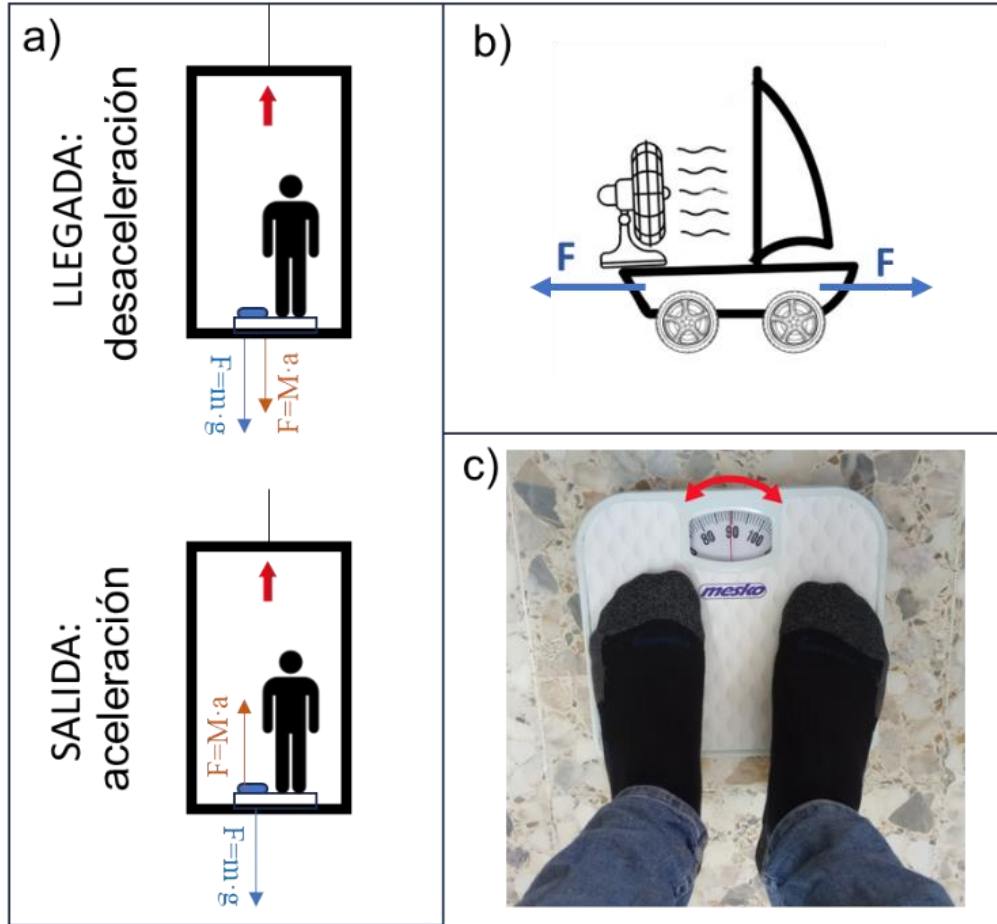

Predictions related with experiment 2	
1	<p>Which way would a sailboat move with the wind against it if the sail is positioned as shown by the green line?</p>  <p>a) It would approach point B b) It would approach point A c) None of the above</p>
2	<p>If on a day with little wind, a giant fan located at the back of the boat is turned on, sending air towards the sail, how does the boat move?</p>  <p>a) It would approach point B b) It would approach point A c) None of the above</p>

Table 2. Questions related with experiment 2. Question #2 was the relevant question to test through P.O.E. strategy.

OBSERVATION step in the teaching of Newton's law

EXPLANATION step in the teaching of Newton's law

RESULTS OF A PILOT EXPERIENCE with MASTER 's students

Did the students predict correctly the experiemnts 1?

Experiment 1

■ right ■ wrong

Experiment 2

■ right ■ wrong

Did the students find useful experiemnt to learn Newton's laws?

■ yes ■ no

■ yes ■ no

Which experiments do students consider to produce a more significant learning of teh Newton's laws?

■ scale ■ sailship

Future Work

1. Test the P.O.E. with secondary students and large statistics.
2. Design new counter-intuitive experiments to introduce other scientific concepts in the curriculum (center of mass, inertia momentum, flotability...).
1. Introduce the use of visual argumentation tools as “Gowin ´s uve” and test their efficiency to enhance scientific reasoning in secondary students.
