Evgeny Aleksandrovich Eremin is the senior lecturer of the Perm State Pedagogical University.

He graduated from the physical faculty of this university in 1977. Since then he has constantly been teaching students there. After 1985, when a new discipline called informatics appeared in Russian schools' schedule, he began to teach many new relative courses.

Evgeny Eremin is a deep specialist in calculating machinery – he wrote his first program in 1974, being a student. He worked with various models of computers and learnt a lot of programming languages. Computer architecture and low-level programming are his favourite disciplines. Evgeny Eremin has many publications in these areas – from popular articles to serious textbooks (in native language).

Last years Evgeny Eremin concerns with problems of knowledge representation. His research in this area is aimed at structuring of learning material and at evaluation of students' conceptual knowledge. In prospect these scientific results can be used for an assessment of learning success.

Evgeny Eremin often participates in International Conferences devoted to different educational aspects. He reports about his original learning software (like educational Pascal compilers or his own educational model of computer "E97") and also about his experimental research in knowledge representation (ontologies, Topic Map and VRML technologies).
