Verena Lyding is a computational linguist working at the language technologies group of the Institute for Specialised Communication and Multilingualism at EURAC.

In 2004 she graduated with a Master of Science in Speech and Language Processing from the University of Edinburgh, after doing her undergraduate studies in computational linguistics at the University of Potsdam.

Since then she has constantly been doing research at the crossroad between linguistics and computer science. Her main research interest is on the creation and usage of language resources, with focus on corpora. She is particularly involved with the users' perspective concerning tools for language analysis and the visualization of linguistic information, intertwining also with the field of Digital Humanities.

Working with EURAC for more than eight years, she has been managing and contributing to nationally and internationally funded research projects concerning corpus and terminological data, interfaces to language resources, computational support for minority languages, etc. She is pursuing a PhD with the University of Erlangen-Nürnberg and has actively participated in numerous European conferences and workshops.
