When we refer to education, we mean more than acquiring knowledge. Today’s reality has proved that having knowledge becomes less and less important in a computerized society. To know “why”, “who”, “how” is getting more and more important.

Labour markets request young graduates who have already had their first work experience, good technical competences and skills that enable them to successfully integrate into the real work atmosphere and give them the opportunity to adjust to the changes brought about by the technological evolution, global competition, aged populations and the modification of the social structures.

In the real work environment, time is money and in industry, construction sites or any other types of enterprises there is no time to waste.

Under the circumstances, the internationalization of education has become a must to be achieved by the latest, modern teaching/learning methods for technical subjects: THE PARTNERSHIP METHOD. This method (contained in the most recent recommendations of the European Parliament and European Commission, Recommendation CE of November 25-th 2009, article 3, line 2) develops in the young generation the ability to adjust themselves to the technological changes generated by fast scientific, social and economic progress, through an active participative instruction which provides them with the educational aspects mentioned above. The use of this method in the vocational training represents a challenge for the nowadays’ educator, since it implies creativity in conception, dynamism in development, flexibility in decision taking processes.

The examples we offer, assuming our presentation will be accepted, are directly linked to the use of the partnership method in the study of several technical subjects through Leonardo da Vinci mobility projects, called Europass and Mobility and Eurogates.

Instead of closing: Once you have fully realized the power of partnership, all your roads will have a finality.
